

District Depends on H₂Orange₂ for Medical Needs Cleaning

It is always the goal of both home and school to keep a child's life as normal as possible during a period of illness that either diminishes the functioning of the immune system, or requires specialized medical treatments that can impact the immune system. For children and young adults, normalcy means being able to attend school.

But how do you assure a clean and sanitized safe school environment for students with compromised immune systems? You need to assure surfaces are "medical needs clean" without using products that can pose harmful chemical exposures.

"Special Needs" Cleaning

Doug Coleman, coordinator of custodial services of the Rockwood School District in Eureka, Mo. takes seriously his mission to provide an extremely clean environment for the district's handful of "special cleaning needs" children.

"As in all school districts, we have a few special needs children who are more susceptible to infection than are others, whether they are coping with special health situations or recovering from illnesses," Coleman states. "With the addition of H₂Orange₂ 117's EPA registration to kill Hepatitis B, we are confident in using this product instead of bleach to protect those children, as well as the general student body."

Experts agree that bleach can be hazardous. Accidental mixing with other cleaning products can create deadly results.

H₂Orange₂ Concentrate 117 Cleaner-Sanitizer-Virucide-HBV, is the industry's original hydrogen peroxide-based cleaner and is the only hydrogen peroxide-based product that is EPA registered. It kills the Hepatitis B virus, in addition to 99.9% of other specified viruses and 99.99% of common bacteria.

Nothing But H₂Orange₂

One of Rockwood School District's custodians is particularly vulnerable to allergic reactions, and had coped with many skin irritations before the district switched to H₂Orange₂ 117. She started out doubting that one product could clean in so many ways and not cause a reaction. Today, she's a believer and proclaims, "Don't fool with my H₂Orange₂!"

"With ... H₂Orange₂ 117's EPA registration to kill Hepatitis B, we are confident in using (it) instead of bleach."

Rockwood School District*

Coleman echoes the sentiment as he relates the use of H₂Orange₂ in the restrooms. "Using H₂Orange₂ with a self-contained cleaning machine has brought amazing changes in our restrooms," he says. "But if we had to use another cleaning product in order to use a particular machine, we'd find another machine.

"H₂Orange₂ is simple and it works," he adds. "We were able to reduce the number of cleaning products from 37 to six, in addition to the fact that we can do the job without constantly worrying about damaging surfaces."

When you are maintaining facilities for nearly 22,000 students, including some with special medical needs, it's nice to know your cleaning product delivers everything you need.
